

Safeguard your critical infrastructure with online server backup

Ask us for details about how to protect your critical servers

Online server backup is a way of using your Internet connection to send a copy of your **entire server** to a backup service provider. Some of the benefits of online server backup include:

- Protect against onsite disasters such as fire or flood
- Be back up and running the same day in the event your server crashes or is otherwise unusable
- Costs are lower with an online backup option as there is no investment in special equipment
- Data is secured through high grade encryption
- Online backup is a managed service that eliminates customer-required management

Don't let technology be an obstacle - ***make IT work for you!***

Axiom Technology Solutions' online server backup service utilizes **Acronis** backup software solution, running on **Microsoft Windows Server 2008** and **Dell PowerEdge** hardware servers for top performance.
